## Group 3 Gear Pumps Technical Information General Information

### Overview

The TuroliaOCG Group 3 is a range of peak performance fixed-displacement gear pumps. Constructed of a high-strength extruded aluminum body with aluminum cover and flange, all pumps are pressure-balanced for exceptional efficiency.

SNP3NN 07SA

SEP3NN 07SA

SEP3NN 07GA

SNP3NN 01BA

### Features

#### Group 3 gear pumps` attributes

- Wide range of displacements from 22 to 90 cm<sup>3</sup>/rev [from 1.34 to 5.49 in<sup>3</sup>/rev]
- Continuous pressure rating up to 250 bar [3625 psi]
- Speeds up to 3000 min<sup>-1</sup> (rpm)
- SAE, DIN and European standard mounting flanges
- High quality case hardened steel gears
- Multiple pump configurations in combination with SNP1NN, SNP2NN and SNP3NN

### Pump displacements

Quick reference chart for pump displacements vs. rated pressure

## Group 3 Gear Pumps Technical Information General Information

### Pump design

#### SEP3NN

The SEP3NN gear pump is available in a limited displacement range from 22.0 to 44.1 cm<sup>3</sup>/rev [from 1.34 to 2.69 in<sup>3</sup>/rev]. Suitable for applications where the pressure is lower than 210 bar [3045 psi], the SEP3NN range is released into SAE and European configurations. The overall length is reduced by 12 mm [0.47 in] in respect of the SNP3NN.

#### SNP3NN

The SNP3NN is available in the full displacement range from 22.0 to 88.2 cm<sup>3</sup>/rev [from 1.34 to 5.38 in<sup>3</sup>/rev], and with higher pressure ratings than the SEP3NN. This is due to the pressure balance on each side of the gears obtained with pressure-balance plates made in antifriction alloy that contribute to high volumetric efficiency and maximum sealing as well.

### ⓘ Caution

The rated and peak pressure mentioned are for pumps with flanged ports only. When threaded ports are required a de-rated performance has to be considered. To verify the compliance of an high pressure application with a threaded ports pump apply to a TurollaOCG representative.

**Determination of nominal pump sizes**

Use these formulae to determine the nominal pump size for a specific application:

**Based on SI units**

**Based on US units**

*Output flow:*  $Q = \frac{V_g \cdot n \cdot \eta_v}{1000} \text{ l/min}$

$Q = \frac{V_g \cdot n \cdot \eta_v}{231} \text{ [US gal/min]}$

*Input torque:*  $M = \frac{V_g \cdot \Delta p}{20 \cdot \pi \cdot \eta_m} \text{ N}\cdot\text{m}$

$M = \frac{V_g \cdot \Delta p}{2 \cdot \pi \cdot \eta_m} \text{ [lbf}\cdot\text{in]}$

*Input power:*  $P = \frac{M \cdot n}{9550} = \frac{Q \cdot \Delta p}{600 \cdot \eta_t} \text{ kW}$

$P = \frac{M \cdot n}{63.025} = \frac{Q \cdot \Delta p}{1714 \cdot \eta_t} \text{ [hp]}$

*Variables:* SI units [US units]

$V_g$	= Displacement per rev.	$\text{cm}^3/\text{rev}$ [ $\text{in}^3/\text{rev}$ ]
$p_{HD}$	= Outlet pressure	bar [psi]
$p_{ND}$	= Inlet pressure	bar [psi]
$\Delta p$	= $p_{HD} - p_{ND}$	bar [psi]
$n$	= Speed	$\text{min}^{-1}$ (rpm)
$\eta_v$	= Volumetric efficiency	
$\eta_m$	= Mechanical (torque) efficiency	
$\eta_t$	= Overall efficiency ( $\eta_v \cdot \eta_m$ )	

# Group 3 Gear Pumps

## Technical Information

<b>A</b>	Mark on the bottom referring to drive gear

## Group 3 Gear Pumps Technical Information System Requirements

### Pressure

The inlet vacuum must be controlled in order to realize expected pump life and performance. The system design must meet inlet pressure requirements during all modes of operation. Expect lower inlet pressures during cold start. It should improve quickly as the fluid warms.

**Peak pressure** is the highest intermittent pressure allowed. The relief valve overshoot (reaction time) determines peak pressure. It is assumed to occur for less than 100 ms. *The illustration to the right* shows peak pressure in relation to rated pressure and reaction time (100 ms maximum).

**Rated pressure** is the average, regularly occurring, operating pressure that should yield satisfactory product life. The maximum machine load demand determines rated pressure. For all systems, the load should move below this pressure.

**System pressure** is the differential of pressure between the outlet and inlet ports. It is a dominant operating variable affecting hydraulic unit life. High system pressure, resulting from high load, reduces expected life. System pressure must remain at, or below, rated pressure during normal operation to achieve expected life.

### Inlet pressure

<b>Max. continuous vacuum</b>	bar abs.	0.8 [23.6]
<b>Max. intermittent vacuum</b>	[in. Hg]	0.6 [17.7]
<b>Max. pressure</b>		3.0 [88.5]

### Time versus pressure

### Speed

**Maximum speed** is the limit recommended by TurollaOCG for a particular gear pump when operating at rated pressure. It is the highest speed at which normal life can be expected.

The lower limit of operating speed is the **minimum speed**. It is the lowest speed at which normal life can be expected. The minimum speed increases as operating pressure increases. When operating under higher pressures, a higher minimum speed must be maintained, as illustrated to the right.

### Speed versus pressure

Where:  
N<sub>1</sub> = Minimum speed at 100 bar  
N<sub>2</sub> = Minimum speed at 180 bar

## Group 3 Gear Pumps Technical Information System Requirements

### Hydraulic fluids

Ratings and data for SNP3NN and SEP3NN gear pumps are based on operating with premium hydraulic fluids containing oxidation, rust, and foam inhibitors. These fluids must possess good thermal and hydrolytic stability to prevent wear, erosion, and corrosion of internal components. They include:

- Hydraulic fluids following DIN 51524, part 2 (HLP) and part 3 (HVLP) specifications
- API CD engine oils conforming to SAE J183
- M2C33F or G automatic transmission fluids
- Certain agricultural tractor fluids

Use only clean fluid in the pump and hydraulic circuit.

#### **ⓘ Caution**

Never mix hydraulic fluids.

Please see TurollaOCG publication *Hydraulic Fluids and Lubricants Technical Information*, **L1021414** for more information.

### Temperature and Viscosity

**Temperature and viscosity requirements** must be concurrently satisfied. Use petroleum / mineral-based fluids.

High temperature limits apply at the inlet port to the pump. The pump should run at or below the maximum continuous temperature. The peak temperature is based on material properties. Don't exceed it.

Cold oil, generally, doesn't affect the durability of pump components. It may affect the ability of oil to flow and transmit power. For this reason, keep the temperature at 16 °C [60 °F] above the pour point of the hydraulic fluid.

Minimum (cold start) temperature relates to the physical properties of component materials.

Minimum viscosity occurs only during brief occasions of maximum ambient temperature and severe duty cycle operation. You will encounter maximum viscosity only at cold start. During this condition, limit speeds until the system warms up. Size heat exchangers to keep the fluid within these limits. Test regularly to verify that these temperatures and viscosity limits aren't exceeded. For maximum unit efficiency and bearing life, keep the fluid viscosity in the recommended viscosity range.

#### *Fluid viscosity*

<b>Maximum (cold start)</b>	mm <sup>2</sup> /s [SUS]	1000 [4600]
<b>Recommended range</b>		12-60 [66-290]
<b>Minimum</b>		10 [60]

#### *Temperature*

<b>Minimum (cold start)</b>	°C [°F]	-20 [-4]
<b>Maximum continuous</b>		80 [176]
<b>Peak (intermittent)</b>		90 [194]

## Group 3 Gear Pumps Technical Information System Requirements

### Filtration

#### Filters

Use a filter that conforms to Class 22/18/13 of ISO 4406 (or better). It may be on the pump outlet (pressure filtration), inlet (suction filtration), or reservoir return (return-line filtration).

#### Selecting a filter

When selecting a filter, please consider:

- contaminant ingress rate (determined by factors such as the number of actuators used in the system)
- generation of contaminants in the system
- required fluid cleanliness
- desired maintenance interval
- filtration requirements of other system components

Measure filter efficiency with a Beta ratio ( $\beta_x$ ). For:

- suction filtration, with controlled reservoir ingress, use a  $\beta_{35-45} = 75$  filter
- return or pressure filtration, use a pressure filtration with an efficiency of  $\beta_{10} = 75$ .

$\beta_x$  ratio is a measure of filter efficiency defined by ISO 4572. It is the ratio of the number of particles greater than a given diameter ( $x$  in microns) upstream of the filter to the number of these particles downstream of the filter.

#### Fluid cleanliness level and $\beta_x$ ratio

<b>Fluid cleanliness level (per ISO 4406)</b>	Class 22/18/13 or better
<b><math>\beta_x</math> ratio (suction filtration)</b>	$\beta_{35-45} = 75$ and $\beta_{10} = 2$
<b><math>\beta_x</math> ratio (pressure or return filtration)</b>	$\beta_{10} = 75$
<b>Recommended inlet screen size</b>	100-125 $\mu\text{m}$ [0.004-0.005 in]

The filtration requirements for each system are unique. Evaluate filtration system capacity by monitoring and testing prototypes.

## Group 3 Gear Pumps Technical Information System Requirements

### Reservoir

The **reservoir** provides clean fluid, dissipates heat, removes entrained air, and allows for fluid volume changes associated with fluid expansion and cylinder differential volumes. A correctly sized reservoir accommodates maximum volume changes during all system operating modes. It promotes deaeration of the fluid as it passes through, and accommodates a fluid dwell-time between 60 and 180 seconds, allowing entrained air to escape.

**Minimum reservoir capacity** depends on the volume required to cool and hold the oil from all retracted cylinders, allowing for expansion due to temperature changes. A fluid volume of 1 to 3 times the pump output flow (per minute) is satisfactory. The minimum reservoir capacity is 125% of the fluid volume.

Install the suction line above the bottom of the reservoir to take advantage of gravity separation and prevent large foreign particles from entering the line. Cover the line with a 100-125 micron screen. The pump should be below the lowest expected fluid level.

Put the return-line below the lowest expected fluid level to allow discharge into the reservoir for maximum dwell and efficient deaeration. A baffle (or baffles) between the return and suction lines promotes deaeration and reduces fluid surges.

### Line sizing

Choose pipe sizes that accommodate minimum fluid velocity to reduce system noise, pressure drops, and overheating. This maximizes system life and performance. Design inlet piping that maintains continuous pump inlet pressure above 0.8 bar absolute during normal operation. The line velocity should not exceed the values in this table:

#### *Maximum line velocity*

<b>Inlet</b>		2.5 [8.2]
<b>Outlet</b>	m/s [ft/sec]	5.0 [16.4]
<b>Return</b>		3.0 [9.8]

Most systems use hydraulic oil containing 10% dissolved air by volume. Under high inlet vacuum conditions the oil releases bubbles. They collapse when subjected to pressure, resulting in cavitation, causing adjacent metal surfaces to erode. **Over-aeration** is the result of air leaks on the inlet side of the pump, and flow-line restrictions. These include inadequate pipe sizes, sharp bends, or elbow fittings, causing a reduction of flow line cross sectional area. This problem will not occur if inlet vacuum and rated speed requirements are maintained, and reservoir size and location are adequate.

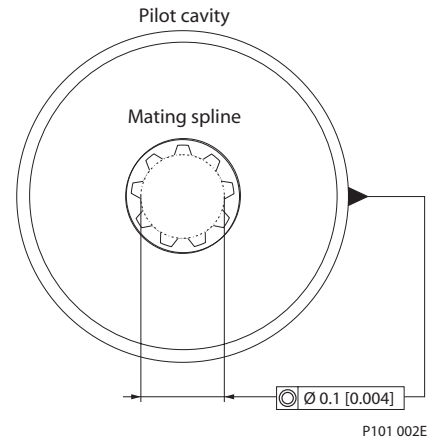

## Group 3 Gear Pumps Technical Information System Requirements

### Pump drive

Shaft options for Group 3 gear pumps include tapered, splined, or parallel shafts. They are suitable for a wide range of direct and indirect drive applications for radial and thrust loads.

**Plug-in drives**, acceptable only with a splined shaft, can impose severe radial loads when the mating spline is rigidly supported. Increasing spline clearance does not alleviate this condition.

Use plug-in drives if the concentricity between the mating spline and pilot diameter is within 0.1 mm [0.004 in]. Lubricate the drive by flooding it with oil. A 3-piece coupling minimizes radial or thrust shaft loads.

### ⚠ Caution

In order to avoid spline shaft damages it is recommended to use carburised and hardened steel couplings with 80-82 HRA surface hardness.

Allowable **radial shaft loads** are a function of the load position, load orientation, and operating pressure of the hydraulic pump. All external shaft loads have an effect on bearing life, and may affect pump performance.

In applications where external shaft loads can't be avoided, minimize the impact on the pump by optimizing the orientation and magnitude of the load. Don't use splined shafts for belt or gear drive applications. A spring-loaded belt tension-device is recommended for belt drive applications to avoid excessive tension. Avoid thrust loads in either direction. Contact TurollaOCG if continuously applied external radial or thrust loads occur.

## Group 3 Gear Pumps Technical Information System Requirements

### Pump drive data form

Photocopy this page and fax the complete form to your TuroliaOCG representative for an assistance in applying pumps with belt or gear drive. This illustration shows a pump with counterclockwise orientation:

#### Optimal radial load position

Distance from flange to center of gear or pulley	<b>a</b>	

## Group 3 Gear Pumps Technical Information System Requirements

### Pump life

**Pump life** is a function of speed, system pressure, and other system parameters (such as fluid quality and cleanliness).

All TurollaOCG gear pumps use hydrodynamic journal bearings that have an oil film maintained between the gear / shaft and bearing surfaces at all times. If the oil film is sufficiently sustained through proper system maintenance and operating within recommended limits, long life can be expected.

---

$B_{10}$  life expectancy number is generally associated with rolling element bearings. It does not exist for hydrodynamic bearings.

---

High pressure, resulting from high loads, impacts pump life. When submitting an application for review, provide machine duty cycle data that includes percentages of time at various loads and speeds. We strongly recommend a prototype testing program to verify operating parameters and their impact on life expectancy before finalizing any system design.

## Sound levels

Fluid power systems are inherent generators of noise. As with many high power density devices, noise is an unwanted side affect. However, there are many techniques available to minimize noise from fluid power systems. To apply these methods effectively, it is necessary to understand how the noise is generated and how it reaches the listener. The noise energy can be transmitted away from its source as either fluid borne noise (pressure ripple) or as structure borne noise.

**Pressure ripple** is the result of the number of pumping elements (gear teeth) delivering oil to the outlet and the pump's ability to gradually change the volume of each pumping element from low to high pressure. In addition, the pressure ripple is affected by the compressibility of the oil as each pumping element discharges into the outlet of the pump. Pressure pulsations will travel along the hydraulic lines at the speed of sound (about 1400 m/s in oil) until affected by a change in the system such as an elbow fitting. Thus the pressure pulsation amplitude varies with overall line length and position.

**Structure borne noise** may be transmitted wherever the pump casing is connected to the rest of the system. The manner in which one circuit component responds to excitation depends on its size, form, and manner in which it is mounted or supported. Because of this excitation, a system line may actually have a greater noise level than the pump. To reduce this excitation, use flexible hoses in place of steel plumbing. If steel plumbing must be used, clamping of lines is recommended. To minimize other structure borne noise, use flexible (rubber) mounts.

*The accompanying graph* shows typical sound pressure levels for SNP3NN pumps (with SAE A flange, and spline shaft in plug in drive) measured in dB (A) at 1 m [3.28 ft] from the unit in a semi-anechoic chamber. Anechoic levels can be estimated by subtracting 3 dB (A) from these values.

---

Contact your TuroliaOCG representative for assistance with system noise control.

Sound levels graph

## Pump performance graphs

The graphs on the next few pages provide typical output flow and input power for Group 3 pumps at various working pressures. Data were taken using ISO VG46 petroleum / mineral based fluid at 50 °C [122 °F] (viscosity = 28 mm<sup>2</sup>/s [132 SUS]).

SNP3NN	02FA	pilot Ø 50.8 mm [2.0 in] European 02, 4-bolt 	Ø 20 mm [0.787 in] parallel 	European flanged port + pattern 
SNP3NN	03FB	pilot Ø 60.3 mm [2.374 in] European 03, 4-bolt 	Ø 22 mm [0.866 in] parallel 	European flanged port + pattern 
SEP3NN SNP3NN	07GA	pilot Ø 101.6 mm [4.0 in] SAE B, 2-bolt 	Ø 22.225 mm [0.875 in] parallel 	Vertical four bolt flanged port 
SNP3NN	01DA	pilot Ø 50.8 mm [2.0 in] European 01, 4-bolt 	Splined shaft 13T - m 1.60 DIN 5482-B22x19 	European flanged port + pattern 
SNP3NN	02DA	pilot Ø 50.8 mm [2.0 in] European 02, 4-bolt 	Splined shaft 13T - m 1.60 DIN 5482-B22x19 	European flanged port + pattern 
SNP3NN	06DD	pilot Ø 105 mm [4.0 in] German, 4-bolt 	Splined shaft 15T - m 1.75 DIN 5482-B28x25 	German std ports port X pattern 
SEP3NN SNP3NN	07SA	pilot Ø 101.6 mm [4.0 in] SAE B, 2-bolt 	Splined shaft SAE J498 13T - 16/32DP 	Vertical four bolt flanged port 

### Mounting flanges

TurollaOCG offers many types of industry standard mounting flanges. This table shows order codes for each available mounting flange and its intended use:

#### Flange availability

Code	Description
01	European 50.8 mm [2.0 in] 4-bolt
02	
03	European 60.3 mm [2.374 in] 4-bolt
06	German 105 mm [4.134 in] 4-bolt
07	SAE B 2-bolt

### Shaft options

Direction is viewed facing the shaft. Group 3 pumps are available with a variety of splined, parallel, and tapered shaft ends. Not all shaft styles are available with all flange styles.

#### Shaft availability and nominal torque capability

Code	Shaft Description	Mounting flange code with maximum torque in Nm [lb-in]				
		01	02	03	06	07
AA	Taper 1:5	-	-	-	300 [2655]	-
BA	Taper 1:8	350 [3097]	350 [3097]	-	-	-
BB	Taper 1:8	-	-	500 [4425]	-	-
DA	Spline 13T DIN 5482-B22X19	290 [2566]	290 [2566]	-	-	-
DD	Spline 13T DIN 5482-B28X25	-	-	-	450 [3982]	-
SA	SAE spline 13T 16/32p	-	-	-	-	270 [2389]
FA	Parallel ø20 mm	210 [1858]	210 [1858]	-	-	-
FB	Parallel ø22.225 mm	-	-	300 [2655]	-	-
GA	Parallel ø22.225 mm	-	-	-	-	230 [2035]

TurollaOCG recommends mating splines conform to SAE J498 or DIN 5482. Turolla OCG external SAE splines have a flat root side fit with circular tooth thickness reduced by 0.127 mm [0.005 in] in respect to class 1 fit. Dimensions are modified to assure a clearance fit with the mating spline.

#### ⚠ Caution

Shaft torque capability may limit allowable pressure. Torque ratings assume no external radial loading. Applied torque must not exceed these limits, regardless of stated pressure parameters. Maximum torque ratings are based on shaft torsional fatigue strength.

# Group 3 Gear Pumps

## Technical Information

### Product Options

#### Port configurations

Various port configurations are available on Group 3 pumps. They include:

- European standard flanged ports
- German standard flanged ports
- Gas threaded ports (BSPP)
- O-Ring boss (following SAE J1926/1 [ISO 11926-1] UNF threads, standard)

A table of dimensions is on the next page.

#### Available port configurations

Code	Description	
A2	8,5x22,23x47,63x $\frac{3}{8}$ -16UNC	SAE flanged port
A3	25x26,19x52,37x $\frac{3}{8}$ -16UNC	
A4	31x30,18x58,72x $\frac{7}{16}$ -14UNC	
A5	37,5/27x35,7x69,85x $\frac{1}{2}$ -13UNC	
B7	20x40xM6	Flanged port with thd holes in <b>X</b> pattern
BA	18x55xM8	
BB	27x55xM8	
BC	36/27x55xM8	
C3	13,5x30xM6	Flanged port with thd holes in <b>+</b> pattern
C7	20x40xM8	
CA	27x51xM10	
CD	36x62xM10	
E6	1 $\frac{1}{16}$ -12UN	Thd SAE O-ring boss port
E8	1 $\frac{5}{16}$ -12UN	
E9	1 $\frac{5}{8}$ -12UN	
EA	1 $\frac{7}{8}$ -12UN	
F5	$\frac{3}{4}$ GAS	Threaded GAS (BSPP)
F6	1 GAS	
F7	1 $\frac{1}{4}$ GAS	

#### H Outlet port

For code letters and descriptions see *the table above*.

# Group 3 Gear Pumps Technical Information Dimensions

## SNP3NN and SEP3NN – 07SA, 07GA (cont.)

*Model code examples and maximum shaft torque*

Flange/drive gear configuration	Model code example	Maximum shaft torque N·m [lb·in]
07SA	SNP3NN/063LN07SAP1A5A4NNNN/NNNNN	270 [2389]
07GA	SNP3NN/026LN07GAP1A3A2NNNN/NNNNN	230 [2035]

For further details on ordering, see *Model Code*, pages 8÷9.

## Our Products

Aluminum Gear Pumps

Aluminum Gear Motors

Cast Iron Gear Pumps

Cast Iron Gear Motors

Fan Drive Gear Motors Aluminum

Fan Drive Gear Motors Cast Iron

## Turolla OpenCircuitGear™

TurollaOCG, with more than 60 years of experience in designing and manufacturing gear pumps, gear motors and fan drive motors of superior quality, is the ideal partner ensuring robustness and reliability to your work functions.

We are fast and responsive - the first to specify a customer product, the most experienced in providing technical knowledge and support for fan drive solutions.

We offer a lean value chain to our partners and customers and the shortest lead time in the market.

TurollaOCG is member of the Sauer-Danfoss Group.
